

The Organ Trail

- Divide students into groups and assign each group an organ. The groups must gather as much information as possible about the organ to create a wanted poster. Some of this information may include what the organ's functions are, what diseases affect the organ and which organ system the organ is contained in. This information can be gathered through books, in the computer lab or through diagrams that you may have set up throughout the classroom. A background for the wanted poster can be obtained at the Science Spot website (see Resource). Have a bulletin board set up so your students can post their wanted posters together.
